## Purpose

The purpose of my project is to develop a professional portfolio. I have amassed quite a few projects that should be grouped together in the form of a portfolio. This portfolio should be usable and presentable to potential clients and other audiences.

### **Audience**

The primary audience for this portfolio is potential employers and other individuals who would benefit from someone with a web developer skill set.

#### Data sources

External API, localStorage, local JSON file., etc

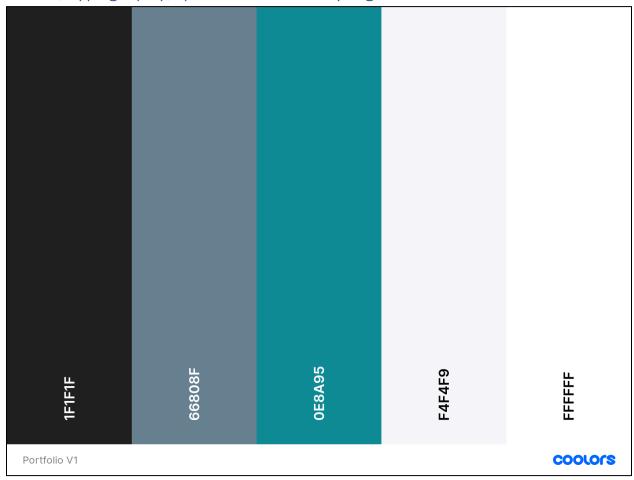

Within my portfolio, I will have a sub project that will be newly developed with this project that will demonstrate an external API. This sub project will take advantage of the Currency Exchange api (ExchangeRate-API - Free & Pro Currency Converter API). It will simply offer two options to compare against, and return the exchange rate.

I will also take advantage of a local JSON file, and local storage in a simple manner.

#### Initial Module list

- Header
- Nav bar
- Card (image, text, button)
- Lists
- Article
- Footer
- Form

Colors/Typography/specific Element styling

Typography – We will utilize a Rubik font and a sans serif font as a backup font. I have chosen this font because it is modern, but strong. It has solid lines without being too serious or aggressive.

<style>

@import

url('https://fonts.googleapis.com/css2?family=Rubik:ital,wght@0,300;0,400;0,500;0,600;1,300;1,400;1,500;1,600&display=swap');

</style>

Elements will be straightforward and sleek. There will be animations and transitions on key elements.
